Company Overview

1.1 Introduction to ATM Mobilis

//

ATM Mobilis (Algérie Télécom Mobilis) is Algeria's foremost mobile network operator and a wholly-owned subsidiary of **Algérie Télécom**. Headquartered in **Algiers** and operating independently since **2003**, the company serves close to **20 million subscribers** across all 58 wilayas of Algeria.

Mobilis provides a comprehensive portfolio of telecommunications services encompassing voice calls, mobile broadband data, SMS messaging, and mobile internet. The company is steered by a **Chief Executive Officer** and a **Board of Directors**, while eight geographically distributed regional offices autonomously manage commercial, technical, and financial activities at the local level.

Over its two decades of operation, ATM Mobilis has demonstrated a consistent drive towards network expansion and technological innovation — most notably through the nationwide deployment of **4G LTE** in 2016 and ongoing investment in **5G-ready** infrastructure. The company remains a key pillar of Algeria's digital development strategy.

1.2 History and Key Milestones

Year	Event / Milestone
2000	Algeria liberalises its telecommunications sector; the national regulatory authority (ARPT) is established.
2003	ATM Mobilis created as an independent subsidiary of Algérie Télécom.
2004	Launch of the first prepaid <i>Djezzy</i> competitive plans and a pilot 3G network.
2010	Subscriber base surpasses 9 million ; new slogan " <i>Partout avec vous</i> " introduced.
2011	10 million subscribers; launch of corporate and mobile banking SMS services.
2014	3G coverage extended to all 48 wilayas ; Mobilis becomes official sponsor of the Algerian Football Federation (FAF).
2016	Nationwide 4G LTE network launched — a landmark in Algerian mobile telecommunications.
2018	Corporate restructuring: Mobilis becomes an independent entity under a national holding structure.
2020	Subscriber base reaches 19 million ; extensive fibre backhaul expansion.
2021	Chaouki Boukhazani appointed CEO; Mobilis earns the <i>Speedtest Award</i> for best national network coverage.
2022	Revenue exceeds 144 billion DZD ; major quality-of-service improvement programme launched.
2023	Celebrates 20 years with the " <i>Twenty</i> " prepaid offer and slogan " <i>Together, We Build the Future.</i> "

Table 1.1: ATM Mobilis — Key Milestones (2000–2023)

1.3 Mission and Strategic Objectives

The corporate mission of ATM Mobilis is to be the **premier mobile telecommunications provider** in Algeria — delivering services that are reliable, accessible, and of the highest quality. This mission is supported by five strategic pillars:

- **Network Excellence** — Continuously expand and maintain a robust, high-performance mobile infrastructure with nationwide coverage.
- **Service Diversity** — Develop a broad product portfolio serving both individual consumers and the enterprise market.
- **Customer Centricity** — Deliver outstanding customer service to build lasting loyalty and satisfaction.
- **Regulatory Integrity** — Ensure strict compliance with ARPT regulations and fair-competition principles.
- **Technological Leadership** — Invest proactively in emerging technologies, including 5G, IoT, and cloud-based solutions.

Organisational Structure

2.1 General Management

//

- **Direction Générale**

The **General Management (Direction Générale)** provides strategic oversight and sets policy for the entire organisation. It is directly supported by four specialised units:

- Internal Audit Department
- Asset Protection and Security
- General Inspection
- Advisory Cell (*Conseillers Stratégiques*)

2.2 Deputy General Management — Operations

This branch governs all revenue-generating and network-related activities through five core divisions:

- **Commercial Division**
 - Distribution & Sales Management
 - Enterprise Market (B2B) Unit
 - Customer Relations Centre
- **Marketing & Communication Division**
 - Product Marketing
 - Brand Strategy & Corporate Communication

- **Network & Services Division**
 - Network Engineering & Development
 - Transmission Infrastructure
 - Deployment & Field Operations
- **IT Systems Division** — ERP, OSS/BSS platforms, cybersecurity
- **Interconnection, Roaming & Regulatory Affairs**

2.3 Regional Offices

ATM Mobilis operates through **eight Regional Offices** (Directions Régionales), each functioning as a semi-autonomous unit responsible for local commercial performance, network maintenance, and administrative management.

2.4 Administration & Finance Division

This division manages internal governance, procurement, and financial performance reporting:

- **General Affairs** — Legal & Contentious Affairs, Procurement & Logistics, Human Resources, Training
- **Finance & Performance** — Financial Accounting, Revenue Assurance & Insurance, Strategy & Planning, Quality Management

Problem Description

3.1 Current Operational Situation

//

• Identified Problem

The reception service of ATM Mobilis — Bab Ezzouar operates a **fully paper-based visitor registration system**. Every visitor arrival and departure is recorded manually in physical logbooks maintained by reception staff. While this approach is simple in principle, it generates a cascade of operational, organisational, and security deficiencies that have grown in severity as visitor traffic increases year on year.

The system currently captures only minimal information — visitor name, declared purpose, and approximate time of visit — with no validation, no backup, and no structure that would enable meaningful analysis or audit. It relies entirely on the individual diligence of reception staff, making outcomes inherently variable and inconsistent.

3.2 Identified Issues and Deficiencies

3.2.1 Time Inefficiency and Congestion

Registering each visitor requires reception staff to **manually transcribe** all details onto paper forms. During peak periods, when several visitors arrive in quick succession, this leads to significant **queue formation and waiting times**, reducing both staff productivity and visitor satisfaction.

3.2.2 Data Loss and Unreliability

Paper records are physically fragile. They may be **misplaced, damaged, rendered illegible**, or lost during office reorganisations. There is no backup mechanism of any kind; any destruction of the logbook results in the permanent and irrecoverable loss of all visitor

history.

3.2.3 Absence of Searchability and Traceability

The existing system offers **no way to query historical records**. It is impossible to determine, at any given moment, how many times a specific individual has visited, which departments they accessed, or whether their stated purpose matched any documented pattern. This absence of traceability is a critical weakness for security audits and compliance purposes.

3.2.4 Lack of Statistical Reporting

Management and security officers have **no access to aggregated visitor data**. Producing even a simple count of daily visitors requires manually counting entries across pages of handwritten logs — an error-prone task that makes any form of data-driven operational decision-making practically unfeasible.

3.2.5 Security Vulnerabilities

Because there is no structured identity capture or cross-referencing process, **visitor identity cannot be reliably verified**. The system provides no mechanism for flagging repeat visits, unauthorised access attempts, or discrepancies between a declared and actual purpose of visit.

3.3

Problem Analysis Summary

//

• Impact Assessment	
Issue Area	Operational Impact
Time Management	Slow intake; queue build-up; reduced reception efficiency
Data Integrity	Risk of loss, duplication, and illegibility
Traceability	No visitor history; audit trail entirely absent
Reporting	No statistics; no dashboard available to management
Security	No identity validation; no access anomaly detection

Collectively, these deficiencies render the current system **inadequate** for an organisation of

Mobilis's operational scale, security requirements, and regulatory obligations. The situation calls for a structured and sustainable digital alternative.

Proposed Solution

4.1 Solution Concept

//

• Digital Visitor Journal

The proposed solution is a **Digital Visitor Journal** — a lightweight, centralised software application that replaces the paper logbook with a structured digital system accessible from the reception workstation.

The application is conceived as a **simple, practical, and immediately deployable tool** rather than a complex enterprise platform, ensuring rapid adoption by non-technical staff with minimal training overhead.

4.2 Core Functional Features

The digital journal will provide the following key capabilities:

- **Visitor Registration Form** — Capture: full name, national ID reference, purpose of visit, time-in, time-out, visitor category (student, professional, other), and affiliated institution where applicable.
- **Centralised Database** — All records stored in a structured, persistent, and searchable repository accessible by authorised staff.
- **Search & History** — Query past visits by name, date, purpose, or department; generate audit-ready visitor histories on demand.
- **Automated Reporting** — Produce daily, weekly, and monthly visitor statistics with one click, exportable for management review.

4.3 Expected Improvements

//

• Anticipated Benefits

Area	Expected Benefit
Time Efficiency	Faster registration; queues eliminated; staff freed for higher-value tasks
Data Quality	Accurate, consistent, and fully recoverable records
Traceability	Complete visitor history; instant audit capability
Reporting	On-demand statistics; real-time management dashboards
Security	Structured identity capture; anomaly-flagging capability

4.4 Design Principles

The application will be guided by three non-negotiable principles: **simplicity** (usable by any reception agent without prior IT training), **reliability** (data integrity guaranteed at all times), and **extensibility** (architecture open to future enhancements such as badge printing, email notifications, or integration with physical access-control systems).

Conclusion

//

• Summary

ATM Mobilis stands as a cornerstone of Algeria’s telecommunications landscape, providing essential mobile services to nearly 20 million subscribers and driving the nation’s digital transformation agenda. Its structured organisation, regional presence, and commitment to innovation create an environment where engineering challenges are both real and impactful.

This internship, conducted at the **Bab Ezzouar Regional Office**, provided a direct, hands-on confrontation with a concrete operational problem: the inefficiency and vulnerability of a manual, paper-based visitor management process. Through systematic observation, stakeholder interviews, and structured analysis, five distinct categories of failure were clearly identified — spanning time management, data integrity, traceability, reporting, and security.

In response, a **Digital Visitor Journal** was proposed as a targeted, lightweight, and immediately viable solution. The system addresses every identified weakness while remaining simple enough for adoption by non-technical reception staff, and open enough for future evolution as organisational needs grow.

This project reflects a broader truth: **digital transformation is not only about 4G networks and cloud infrastructure — it also means modernising the administrative processes that sustain daily operations.** As Mobilis continues to lead Algeria’s connectivity ambitions, aligning internal processes with the same standard of efficiency represents both an opportunity and a responsibility.

“Together, We Build the Future.”

— ATM Mobilis Corporate Slogan, 2023
